

Digital Transformations have the power to revolutionise business.

Ambitious business owners are always looking for new ways to help their business develop, improve and grow, no matter how successful it already is. Don't get left behind.

You'll also want to improve the experience for your customers.

And of course, you'll be aware that your IT infrastructure plays a big part in this growth and the overall experience.

That works both ways. Sometimes it's that same infrastructure that can limit how your business evolves. If you're running older systems, or perhaps systems that don't fully meet your needs, growth can be held back.

THIS IS WHERE DIGITAL IT TRANSFORMATION COMES IN.

Maybe you've never heard that term before. Or perhaps the concept is new to you.

Here's a one line explanation:

Digital IT transformation is about using modern technology to create or modify business processes, culture and customer experiences.

It involves a complete reassessment and overhaul of your technology, with the goal of improving the efficiency and delivery of your products or services.

We can make this easier with a few case studies of how big businesses you've definitely heard of, used digital IT transformation.

Just because these are big names doesn't mean it isn't relevant to you... this is for all businesses, of all sizes.

NETFLIX

Are you old enough to remember when Netflix's business model was based on direct mail?

They'd post their customers in the US a DVD. Customers would watch it, post it back, then wait a few days for another DVD to arrive through their letterbox. We had a similar service called LoveFilm here in the UK (which was eventually bought by Amazon).

Of course, Netflix led the way to the streaming world we enjoy today.

That was digital IT transformation. They used technology to flip their business model on its head.

This has not only improved customer experience (now you wait seconds instead of days for a movie), but it's also increased customer loyalty too. As of March this year, Netflix has a market value of £123 billion.

LEGO

Believe it or not, in 2004, Lego was on the brink of bankruptcy.

This pushed the company to start its digital IT transformation journey, which is still ongoing today.

First, Lego digitised its supply chain processes, which allowed it to gain more insight into production delays and manufacturing costs.

Then between 2008 and 2016 the company centralised its HR applications, moved to a digitised shop floor system, and streamlined its decision-making processes.

To improve customer experience, Lego added mobile apps, games and even movies to its products. The first Lego film generated an additional £354 million in revenue (off a production budget of £45 million).

KODAK

When you think of Kodak today, you think of a dead camera company.

As the digital revolution took hold at the start of the century, cameras evolved from using film to storing photos digitally.

Kodak held firm with film (despite inventing the first digital camera!) under the impression that launching a digital camera would cannibalise its existing business.

Which we now know was not the case. Kodak's failure to digitally transform at the right time led to the company losing a lot of money, and bankruptcy in 2012.

Eventually, after a big financial loss, Kodak took the step towards digital photography, but it was too late.

Of course, these are extreme cases and big famous businesses, but they highlight just what a difference embracing digital IT transformation (or failing to embrace it) can make to your business.

There are 4 main areas of transformation that you need to consider:

1 PROCESS TRANSFORMATION

This is most appropriate when a business needs a radical transformation.

It can modernise your processes, integrate new technology, and save money, while still incorporating your core systems.

It's safe to say that process transformation can result in the most drastic changes to your business.

Before you begin, and to help decide whether it's the right step for you right now, you need to ask yourself what your goals are for transformation:

- Do you need to upgrade your systems?
- Will you need to bring in new technology?
- Will you change your processes to a new structure?

It's really important to set baseline metrics when deciding on process transformation. These will help you understand if the transformation is a success.

So as well as setting new KPIs (Key Performance Indicators), you should also set baseline metrics based on your expectations of the new structure, and the typical results of your old structure.

Include things like time, cost, errors and downtime suffered.

You should involve your team in this process. Ask for feedback on how your current system is working, it's benefits and drawbacks.

Find out how the people using the systems would make improvements, and how their jobs could be made simpler. What would they like to see in a new system? How can they see new processes improving their role and making them more productive?

This kind of feedback can give you the most valuable insight into how your systems should be working to make the biggest improvement.

And before you embark on process transformation, you should create an ideal workflow path.

This will help you identify the areas that you need to focus on first, and to really understand both the system tasks that take place, and the human element too.

2 BUSINESS MODEL TRANSFORMATION

As we saw in the case studies, it's possible to adapt or even completely reinvent your current business model to open up new opportunities for growth.

Never has this been more evident than in our post-pandemic society. Covid-19 really changed the way we think about customer experience and digitisation of products and services.

As businesses we were forced to make quick decisions and digitally transform practically overnight.

And although there was some tweaking along the way, we learnt a lot about the barriers that are actually in place to prohibit change, and those that we place there ourselves - you just need to look at the way the healthcare industry quickly overcame privacy concerns when it shifted to virtual appointments.

Not every business model transformation needs to be at the level of Netflix. It could mean something as simple as using data to offer customers add-on products and services that complement what they already buy, and the needs they've communicated to you.

There are 4 main areas of transformation that you need to consider:

3 DOMAIN TRANSFORMATION

This is not necessarily the most commonly used area of digital IT transformation, but it's worth your consideration.

New technologies have the ability to redefine your products or services in a big way. A good example of this is the way Amazon moved into a new domain with AWS (Amazon Web Services).

AWS is now the most popular cloud service provider in the world.

While it wasn't an obvious move for Amazon to dip a toe into the cloud computing industry, it was able to leverage services it already used - in this case, massive storage capacity - to create a brand new offering to its customers.

Lego also did this with its expansion into film and gaming.

Think about the products and services you already offer. Is there anything that you currently use that could be leveraged to offer another product or service?

4 ORGANISATIONAL TRANSFORMATION

It's crucial that if your business spends time and money updating its technology and designing its processes and products, that its internal values and behaviours evolve to mirror this change, too.

Failure to get buy-in from your people could result in the complete failure of your transformation, even if everything else is primed to work. Just a little resistance can mean adoption of your new technology is slower than it should be.

And you don't need me to point out that the result of this would be a loss of revenue, productivity, and potentially even your people.

Make the time to clearly communicate your vision for transformation. Do this regularly. Involve your people in the processes, and ask for - and importantly, listen to - their feedback along the way. Everyone should understand the risk and why it's worth taking.

The rules

Regardless of your sector or industry and your current infrastructure and systems, any digital IT transformation strategy has 3 very important rules:

RULE 1:

You must modernise your existing critical IT infrastructure if you want to increase efficiency and your management overheads.

RULE 2:

You must automate your IT processes if you want to reduce risk and accelerate provisioning and deployment of applications. This includes automating the delivery and use of IT services.

RULE 3:

You must transform your IT processes and operations if you want to align your IT goals, your staff and their roles.

Of course, this is a very brief overview to a process that can be extremely complex.

Here's a great quote on this, from transformation scientist George Westerman:

“When digital transformation is done right, it’s like a caterpillar turning into a butterfly, but when done wrong, all you have is a really fast caterpillar.”

That means, without the right investment from you, digital IT transformation just won't happen. You need to have the right systems in place, but if you don't know how to use them properly, you haven't really transformed anything.
